## DEPARTMENT OF TRAINING AND PLACEMENTS

### Soft Skills Training and Placements

Date of Conduction: 03-08-2023 to 08-08-2023

Venue: (NB) Class Rooms, KSIT

Time: 8.50 AM. TO 3.50 PM

Duration: 30 HOURS

### Objective of the Training Program

The sole objective of imparting Soft skills training program is to enable students to learn critical evaluation techniques and various real life situations by resorting to analyze key issues. This training program will help students to enhance the problem solving skills, improve Communication skills, discover their interests and career choices, to maximize potentialities and boosting self-confidence, understanding high demand in society and have good job prospects and to help students prepare for competitive examinations and higher studies.

### Soft Skills

Strong communication skills:- Improves the ability to speak professional English, building positive relationships with stakeholders, and showing inspiring leadership qualities – typically called “Soft Skills” – are becoming increasingly essential for degree and manufacturing professionals.

Many Degree professionals assume that their technical expertise and experience is the only thing that will get them a job. However, this is changing as engineers are increasingly expected to partner with the business, and these soft skills – when coupled with the right combination of technical skills – are in great demand, and can set them apart in a highly competitive jobs market. Soft skills are all those personal attributes that sit outside professional qualifications and work experience. They refer to how people interact, lead and communicate with other people, and they're an essential foundation for any successful career. There is no doubt about the fact that the technical skills are an absolute essential for an engineer to perform his job diligently and efficiently. The fact that the second skill set, that is, the soft skills along with the hard skills are an absolute essential for growth of an engineer in the organization. A blend of both is what determines their level of success as a professional. A soft skill is not just limited to the workplace of a professional but extends to other spheres of their life too for example social and family.

Soft skills is not just about communicating, but includes ability to manage stress, ability to organize, ability to provide solutions. Most of the times the importance of soft skills is ignored and not given adequate attention for engineers. The education that goes in to make an engineer does not concentrate on the people skills. The curriculum tends to ignore the fact that at the end of the day an engineer would be working in a team, reporting to someone, taking reports, dealing with work pressures, giving presentations, attending phone calls, sending mails just to specify a few. In all such situations along with technical skills, experience and physiological maturity of an individual is going to play an important role.

Schedule for Training

Before starting with the training, need of CAD and CAE technologies were discussed and the discussed matter is as follows.

### **About Training:**

Technology has advanced at an ever increasing, almost exponential rate. In fact, technology development moves faster than the consumers understanding of the resulting product enhancements. When an activity of the product development cycle is carried out in a virtual or soft environment, the primary benefit is the time saving and hence cost saving

Computer Aided Engineering is a technology concerned with the use of computer systems to analyze CAD geometry, allowing the designer to simulate and study how the product will behave so that design can be refined and optimized.

### **History of FEA:**

Finite Element Analysis (FEA) was first developed in 1943 by R. Courant, who utilized the Ritz method of numerical analysis and minimization of variational calculus to obtain approximate solutions to vibration systems. Shortly thereafter, a paper published in 1956 by Turner, Clough, Martin, & Top established a broader definition of numerical analysis. This paper centered on the "stiffness and deflection of complex structures".

By the early 70's, FEA was limited to expensive mainframe computers generally owned by the aeronautics, automotive, defense, and nuclear industries, and the scope of analyses were considerably limited. Such people as Zeinkiewich & Cheung further enhanced finite Element technology during the 70's, when they applied the technology to general problems described by Laplace & Poisson's equations. Mathematicians were developing better solution algorithms, the Galerkin, Ritz & Rayleigh-Ritz methods emerged as the optimum solutions for certain categories of general type problems. Later, considerable research was carried out into the modeling & solution of non-linear problems, Hinton & Crisfield being major contributors. While considerable strides were made in the development of the finite element method, other areas did not remain static. Very powerful mesh generation algorithms have been developed. Commercial generators have the capability of meshing all but the most difficult geometry. Superior CAE concepts have also emerged; it is not unusual to have a single CAD model for producing engineering drawings, carrying out kinematics & assembly analysis, as well as being used

for finite element modeling. Due to the rapid decline in the cost of computers and the phenomenal increase in computing power, present day desktop computers are capable of producing accurate results for all kinds of parameters (standard PC's are over 10 times more powerful than the best supercomputers of the early 90's)

The finite element method now has its roots in many disciplines, the end result is a technology that is so advanced that it is almost indistinguishable from magic. The vast catalog of capability that comprises FEA will no doubt grow considerably larger in the future. CAE is here to stay, but in order to harness its true power, the user must be familiar with many concepts, including the mechanics of the problem being modeled. All analyses require time, experience & most importantly, careful planning.

The finite element method is being used in virtually every engineering discipline. Aerospace, automotive, biomedical, geotechnical, electrical, hydraulic, and nuclear engineering applications have become standard objects for finite element analysis. In addition, it is not only used for analyzing classical static structural problems, but also for such diverse areas as mass transport, heat transfer, dynamics, stability, and radiation problems. Like any other approximate numerical method, the solution produced by finite element analysis contains a certain amount of error. The magnitude of the error is highly dependent on the type, size, and fineness of the model used for the analysis. That's why not all finite element models are created equal. Indeed, the educational and industrial experiences of the analyst as well as the sophistication of the software are the most critical factors in obtaining reliable results.

### **Finite Element Analysis:**

Is the simulation of a physical system (geometry and loading environment) by a mathematical approximation of the real system. Using simple, interrelated building blocks called elements; a real system with infinite unknowns is approximated with a finite number of unknowns. A FEA Model is the mathematical idealization of the real system.

## **A Typical Analysis Procedure:**

In the real world, no analysis is typical, as there are usually facets that cause it to differ from others. There is however a main procedure that most FE investigations take. This procedure is detailed below:

### **Planning the Analysis:**

This is arguably the most important part of any analysis, as it helps ensure the success of the simulation. Oddly enough, it is usually the one analysts leave out. The purpose of an FE analysis is to model the behavior of a structure under a system of loads. In order to do so, all influencing factors must be considered & determined whether their effects are considerable or negligible on the final result. The degree of accuracy to which any system can be modeled is very much dependant on the level of planning that has been carried out.

### **Pre-Processor**

The preprocessor stage in general FE packages involves the following:

1. Specifying the title that is the name of the problem. This is optional but very useful,
2. Setting the type of analysis to be used, e.g. structural, fluid, thermal or electromagnetic, etc. (sometimes this can only be done by selecting a particular element type). Especially if a number of design iterations are to be completed on the same base model.
3. Creating the model. The model is drawn in 1D, 2D or 3D space in the appropriate units (M, mm, in, etc..). The model may be created in the pre-processor, or it can be imported from another CAD drafting package via a neutral file format (IGES, STEP, ACIS, Parasolid, DXF, etc.). If a model is drawn in mm for example and the material properties are defined in SI units, then the results will be out of scale by factors of  $10^6$ . The same units should be applied in all directions, otherwise results will be difficult to interpret, or in extreme cases the results will not show up mistakes made during the loading and restraining of the model.

4. Defining the element type, this may be 1D, 2D or 3D, and specific to the analysis type being carried out (you need thermal elements to do thermal analyses).

5. Applying a Mesh. Mesh generation is the process of dividing the analysis continuum into a number of discrete parts or finite elements. The finer the mesh, the better the result, but the longer the analysis time. Therefore, a compromise between accuracy & solution speed is usually made.

6. Assigning properties. Material properties (Young's modulus, Poisson's ratio, the density, & if applicable, coefficients of expansion, friction, thermal conductivity, damping effect, specific heat etc.) will have to be defined. In addition element properties may need to be set. If 2D elements are being used, the thickness property is required. 1D beam elements require area,  $I_{xx}$ ,  $I_{yy}$ ,  $I_{xy}$ ,  $J$ , & a direction cosine property, which defines the direction of the beam axis in 3D space. Shell elements, which are 2½D in nature (2D elements in 3D space), require orientation & neutral surface offset parameters to be defined. Special elements (mass, contact, spring, gap, coupling, damper etc.) require properties (specific to the element type) to be defined for their use.

7. Apply Loads. Some type of load is usually applied to the analysis model. The loading may be in the form of a point load, a pressure or a displacement in a stress (displacement) analysis, a temperature or a heat flux in a thermal analysis & a fluid pressure or velocity in a fluid analysis. The loads may be applied to a point, an edge, a surface or a even a complete body. The loads should be in the same units as the model geometry & material properties specified. In the cases of modal (vibration) & buckling analyses, a load does not have to be specified for the analysis to run.

8. Applying Boundary Conditions. If you apply a load to the model, then in order to stop it accelerating infinitely through the computer's virtual ether (mathematically known as a zero pivot), at least one constraint or boundary condition must be applied. Structural boundary conditions are usually in the form of zero displacements, thermal BCs are usually specified temperatures, fluid BCs are usually specified pressures. A boundary condition may be specified to act in all directions (x, y, z), or in certain directions only. They can be placed on nodes, key points, areas or on lines. BC's on lines can be in the form of symmetric or anti-symmetric type boundary conditions, one allowing in plane rotations and out of plane translations, the other allowing in plane translations and out of

plane rotations for a given line. The applications of correct boundary conditions are a critical to the accurate solution of the design problem. At least one BC has to be applied to every model, even modal & buckling analyses with no loads applied.

### **Solution**

Thankfully, this part is fully automatic. The FE solver can be logically divided into three main parts, the pre-solver, the mathematical-engine & the post-solver. The pre-solver reads in the model created by the pre-processor and formulates the mathematical representation of the model. All parameters defined in the pre-processing stage are used to do this, so if you left something out, chances are the pre-solver will complain & cancel the call to the mathematical-engine. If the model is correct the solver proceeds to form the element-stiffness matrix for the problem & calls the mathematical-engine, which calculates the result (displacement, temperatures, pressures, etc.). The results are returned to the solver & the post-solver is used to calculate strains, stresses, heat fluxes, velocities, etc.) for each node within the component or continuum. All these results are sent to a results file, which may be read by the post-processor.

### **Post-Processor**

Here the results of the analysis are read & interpreted. They can be presented in the form of a table, a contour plot, deformed shape of the component or the mode shapes and natural frequencies if frequency analysis is involved. Other results are available for fluids, thermal and electrical analysis types. Most post-processors provide an animation service, which produces an animation & brings your model to life.

Contour plots are usually the most effective way of viewing results for structural type problems. Slices can be made through 3D models to facilitate the viewing of internal stress patterns.

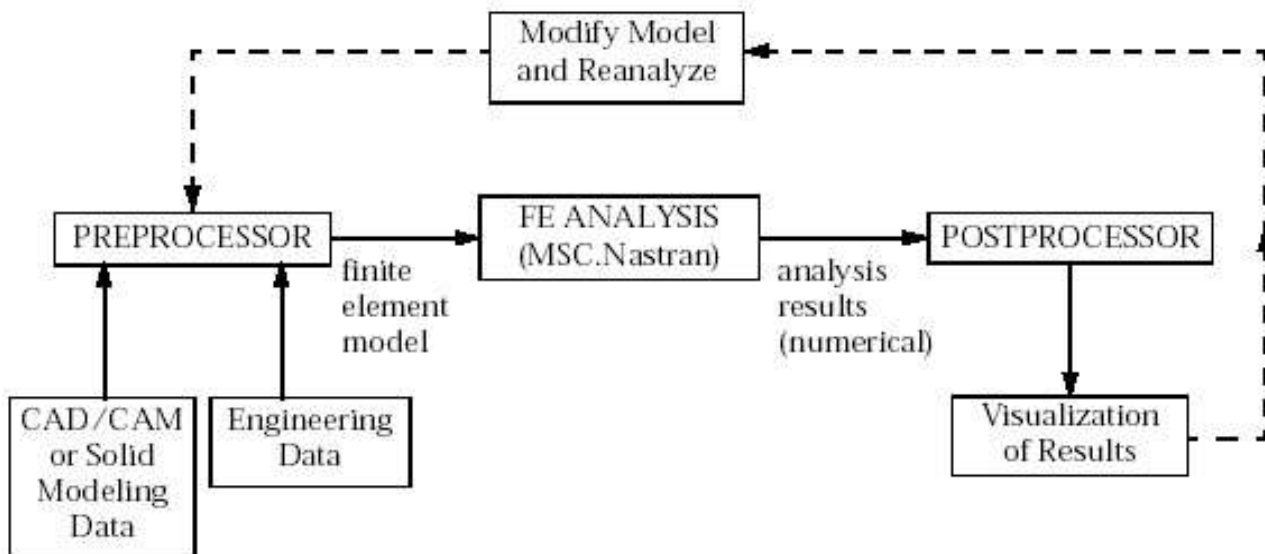

All post-processors now include the calculation of stress & strains in any of the x, y or z directions, or indeed in a direction at an angle to the coordinate axes. The principal stresses and strains may also be plotted, or if required the yield stresses and strains according to the main theories of failure (Von mises, St. Venant, Tresca etc.). Other

information such as the strain energy, plastic strain and creep strain may be obtained for certain types of analyses.

A Final Word The finite element method is extremely powerful. However, with comforting contour plots, one can be easily fooled into thinking that a superior result has been achieved. The quality of the result is totally dependent on the quality of the analysis model & how accurately it represents the physical problem being investigated. Careful planning is the key to a successful analysis. Sometimes an analysis is not required, as some problems have analytical or empirical solutions; others may be determined using spreadsheets.

General finite element process is illustrated as below:

### IMPORTING AND EXPORTING DATA

The cad models in step and sat file format creation is important for importing into analysis softwares for further analysis.

As part of training , the following problems were given training to the students.

## **CASE STUDY 1: RECTANGULAR PLATE WITH ELLIPTICAL HOLE**

### **Objectives:**

- Manually create the geometry using the given dimensions then apply finite elements.
- Manually define material and element properties.
- Apply symmetric boundary constraints.
- Apply edge load to model.
- Run the analysis in ansys

### **MODEL DISCRIPTION:**

Below is a schematic of a plate with a elliptical hole at the center. The dimensions and loads are indicated. The finite element model will be simplified by creating the 1/4 tension model with two simple surfaces as shown in Fig. The plate is 10mm thick; therefore it will be modeled with shell elements. The resulting finite element model will have x- and y-symmetry constraints. The uniform load of 30 kg will be applied to the right edge.

All dimensions are in mm

From ansys :

$$K=0.0635/0.047=1.35$$

**Biaxial Loading:**

$$\text{Maximum stress } (\sigma_{\max}) = 2.66 \text{ kg/mm}^2$$

$$\text{Nominal stress } (\sigma_{\text{nom}}) = 1.381 \text{ kg/mm}^2$$

$$\begin{aligned} \text{Stress Concentration Factor (K)} &= \sigma_{\max} / \sigma_{\text{nom}} \\ &= 2.66 / 1.381 \end{aligned}$$

$$K=1.92$$

**CASE STUDY 2: FRAME OF A PUNCH PRESS.**

**Objective:**

To find the stresses at the inner and outer surface at section of a punch press with load  $W=5000\text{N}$

Fig: Dimensional Details

Given:  $W=5000\text{N}$ ,  $b_i = 18\text{mm}$ ,  $b_o = 6\text{mm}$ ,  $h=40\text{mm}$ ,  $R_i = 25\text{mm}$ ,  $R_o = 25+40=65\text{mm}$ .

Wkt area of section X-X,

$$A = \frac{1}{2}(18+6) \times 40 = 480\text{mm}^2$$

Radius of curvature of the neutral axis ,

$$R_n = \frac{(b_i + b_o/2)h}{(b_i R_o - b_o R_i / h) \log(R_o / R_i)(b_i - b_o)}$$

$$R_n = \frac{(18+6/2)*40}{(18*65-6*25/40) \log(65/ 25)( 18 -6)}$$

$$R_n = 38.83\text{mm}.$$

Radius of curvature of the centroidal axis,

$$R = R_i + \frac{h(b_i + 2b_o)}{3(b_i + b_o)} = 25 + \frac{40(18+2*6)}{3(18+6)}$$

$$R = 41.67\text{mm}.$$

Distance between the centroidal and neutral axis,

$$E = R - R_n = 41.67 - 38.83 = 2.84\text{mm}$$

And the distance between the load and centroidal axis,

$$X = 100 + R = 100 + 41.67 = 141.67\text{mm}.$$

Therefore bending moment about the centroidal axis ,

$$M = W.x = 5000 * 141.67 = 708350 \text{ N-mm}.$$

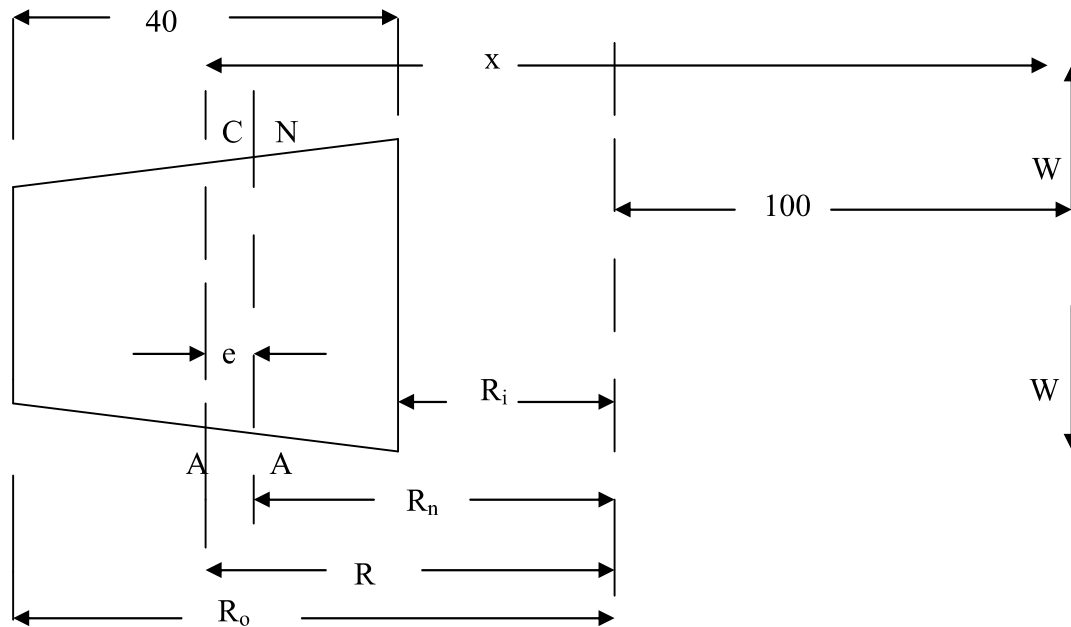

Fig: Sectional details

The direct tensile stress at section X-X.

$$\sigma_t = W/A = 5000/480 = 10.42 \text{ N/mm}^2$$

Distance from the neutral axis to the inner surface,

$$y_i = R_n - R_i = 38.83 - 25 = 13.83 \text{ mm}$$

Distance from the neutral axis to the outer surface,

$$y_o = R_o - R_n = 65 - 38.83 = 26.17 \text{ mm.}$$

Wkt maximum bending stress at the inner surface,

$$\begin{aligned} \sigma_{bi} &= \frac{M \cdot y_i}{A \cdot e \cdot R_i} = \frac{708350 \cdot 13.83}{480 \cdot 2.84 \cdot 25} = 287.4 \text{ N/mm}^2 \\ &= 287.4 \text{ Mpa (tensile)} \end{aligned}$$

Maximum bending stress at the outer surface,

$$\sigma_{bo} = \frac{M \cdot y_o}{A \cdot e \cdot R_o} = \frac{708350 \cdot 26.17}{480 \cdot 2.84 \cdot 65} = 209.2 \text{ N/mm}^2$$

$$= 209.2 \text{ Mpa (compressive)}$$

**Therefore resultant stress on the inner surface**

$$= \sigma_t + \sigma_{bi} = 10.42 + 287.4 = 297.82 \text{ Mpa (tensile)}$$

**Resultant stress on the outer surface,**

$$= \sigma_t - \sigma_{bo} = 10.42 - 209.2 = -198.78 \text{ Mpa (compressive)}$$

FROM FEA METHOD:

FE Model of a punch press.

Fig: Mesh model

Due to half symmetry, half model with symmetrical boundary conditions were analysed.

Results from FEA

**Stress – Von Mises**

**Resultant stress on the inner surface,**

**= 286.4 Mpa (tensile).**

**Resultant stress on the outer surface,**

**= 191.0 Mpa (compressive)**
